Clean version of paragraph on page 7 spanning from
line 13 to line 27

Likewise, numerous publications have reported genetic forms of Alzheimer's disease [Campion *et al.* Neurology 45(1):80-85 (1995)]. A Medline database search from 1976 to April 1995 for references addressing familial Alzheimer's disease and stress proteins generated only one match [Guillemette *et al.*, J. Neuro-chem. 47(3):987-997 (1986)], but actually this paper did not mention that any of its Alzheimer patients had a genetic form of the disease. The report by Guillemette *et al.* described studies on RNA transcripts obtained from post-mortem Alzheimer's brain biopsy samples. They observed elevated levels of hsp mRNA transcripts in brain samples from Alzheimer patients who had fever immediately prior to death. They also studied human brain mRNA translation (i.e., protein) products. Guillemette *et al.* reported, in part, that
